Booths Multiplication Algorithm

Multiplication Algorithms: —

Multiplication of two fixed point binary number in signed magnitude representation is done as follows

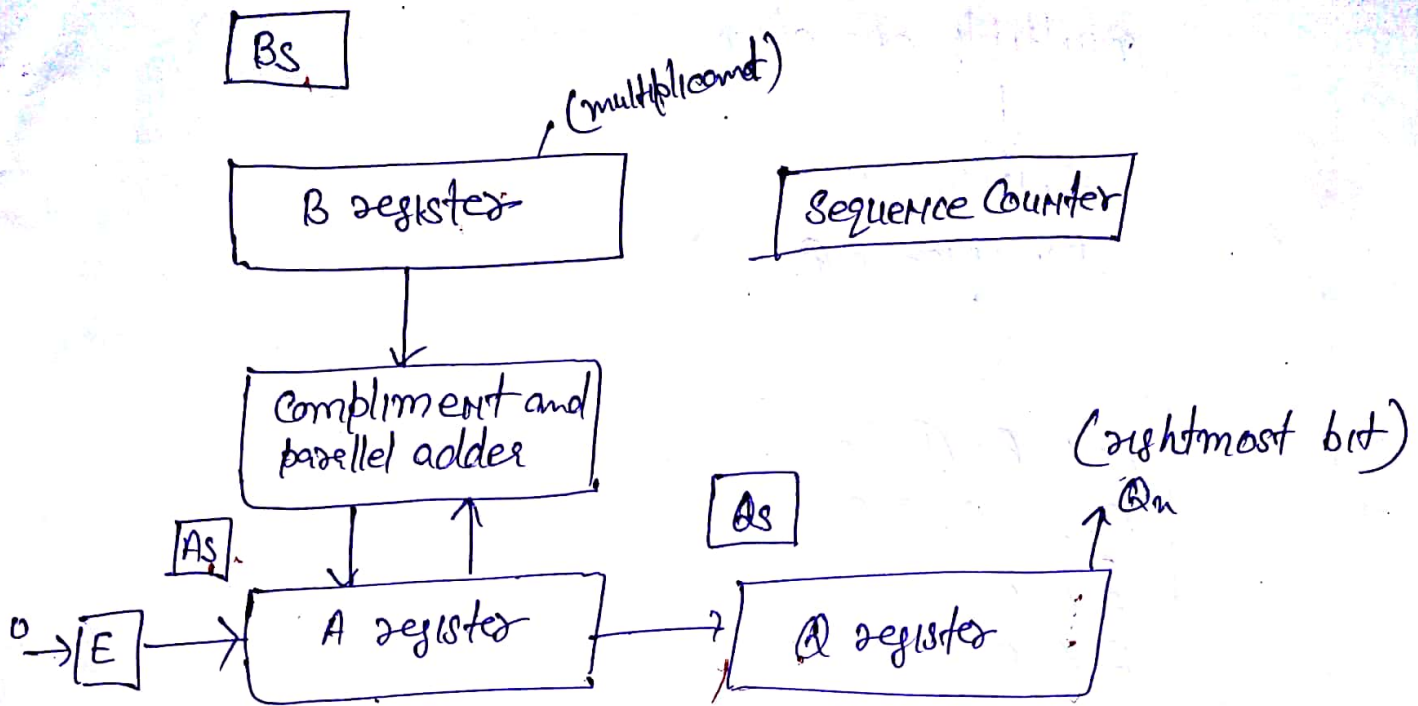

$$\begin{array}{r} 23 \\ \times 19 \\ \hline 437 \end{array} \quad \begin{array}{r} 1011 \text{ multiplicand} \\ 1001 \text{ multiplier} \\ \hline 1011 \\ 1011 \\ 00000 \\ 00000 \\ 10111 \\ \hline 1101101 \text{ Product} \end{array}$$

The process consist of looking at successive bits of the multiplier, LSB first. If multiplier bit is 1, multiplicand is copied down otherwise 0's are copied down. The numbers copied down in successive lines are shifted one position left.

Hardware Implementation :

When multiplication is done in

- a digital computer certain changes are made to ^{the} process.
- ① Instead of providing registers to store and add simultaneously as many binary numbers as there are bits in multiplier, it is convenient to provide an adder to add two no's and successively accumulate the partial product in a register.
 - ② Instead of shift multiplicand to the left, partial product is shifted right
 - ③ If corresponding bit of multiplier is 0, no need to copy and add 0's to partial product.

Hardware for multiply operation

→ Sequencer is initially set to number of bits in multiplier
 → Initially multiplicand is in Register B and multiplier is in Q. The sum of A and B forms a partial product which is transferred to EA. Both partial product and multiplier are shifted right. This shift is denoted by the statement shr EAQ. The LSB of A is shifted into msb of Q, the bit from E is shifted into A and 0 is shifted into E. After the shift, one bit of partial product is shifted into Q, pushing the multiplier bit one position to right. In this manner the rightmost flip flop in register Q will hold the bit of multiplier, which must be inspected next.

flow chart for multiply operation

$$\begin{array}{r} 1011 \text{ multiplicand} \\ \times 1001 \text{ multiplier} \\ \hline \end{array}$$

$$\begin{array}{r} -9 \\ 3 \\ \hline -9 \end{array}$$

Multiplicand $B = 1011$

	E	A	Q	SC
Multiplicand in Q	0	00000	1001	10

① $Q_n = 1$, add B.
First partial product
Shift right EAA

0	1011		
0	0101	1100	100
0	0010	1011	

$Q_n = 1$, add B.
Second partial product
Shift right EAA

1	0000	0	
0	1000	0110	011
0	0100	0011	010
0	0010	0101	001

$Q_n = 0$ shr EAA

$Q_n = 0$ shr EAA

$Q_n = 1$ add B

5th partial product
shr EAA

0	1011		
0	1101		
0	0110	1010	000

Final Product in A Q

Booth Multiplication Algorithm \rightarrow

Booth gave a procedure for multiplying binary integers in signed 2's complement representation. It operates on the fact that string of 0's in the multiplier require no addition but just shifting, and a string of 1's in the multiplier from bit weight 2^k to 2^m can be treated as $2^{k+1} - 2^m$.

e.g. binary number 001110 (+14) has string of 1's from 2^3 to 2^1 i.e. $k=3, m=1$

$$\text{So } 2^{k+1} - 2^m$$

$$= 2^4 - 2^1 = 16 - 2 = 14.$$

Therefore the multiplication $m \times 14$ (m is multiplicand and 14 is multiplier) can be done as $m \times 2^4 - m \times 2^1$. Thus the product can be obtained by shifting the binary multiplicand 4 times left and subtracting m shifted once.

Booth also requires examination of multiplier bits and shifting of partial product. Prior to the shifting, the multiplicand may be added to the partial product, subtracted from the partial product or left unchanged as per following rules.

- ① The multiplicand is subtracted from partial product upon encountering the first least significant 1 in a string of 1's in the multiplier
- ② The multiplicand is added to partial product upon encountering the first 0 (provided that there was a previous 1) in a string of 0's in the multiplier
- ③ The partial product does not change when the multiplier bit is identical to the previous multiplier bit.

Fig Hardware for booth Algo.

- Q_n designates the LSB of multiplier in register QR
- An extra flip flop Q_{n+1} is to facilitate a double bit inspection.

0 0	ash \rightarrow (AC, QR, Q_{n+1})	11110	01011	0	001
1 0	subtract BR	$\begin{array}{r} 0100 \\ \underline{0100} \\ 0000 \end{array}$			
	ash \rightarrow (AC, QR, Q_{n+1})	00011	10101	1	000

(000110101) Ans

2^1 's complement of $-9 = 1011$

2^1 's complement of $-13 = 1001$

$-9 \times -13 = +117 = 1110101$ Ans

Q1 Solve Using Booth Algo

$$(+15) \times (+13) = (+195) = (0011000011)_2$$

$$BR = 01111 \quad \overline{BR} + 1 = 10001 \quad QR = 01101$$

Q _n Q _{n+1}	AC	QR	Q _{n+1}	Sc
Initial	00000	01101	0	101

10
Subtract BR

$$\begin{array}{r} 10001 \\ - 10001 \\ \hline 00000 \end{array}$$

ashr

$$\begin{array}{r} 10000 \ 01101 \ 1 \ 100 \\ \hline \end{array}$$

01
Add BR

$$\begin{array}{r} 01111 \\ + 00111 \\ \hline 10110 \end{array}$$

ashr

$$\begin{array}{r} 00011 \ 11011 \ 0 \ 011 \\ \hline \end{array}$$

10
Subtract BR

$$\begin{array}{r} 10001 \\ - 10100 \\ \hline 00101 \end{array}$$

ashr

$$\begin{array}{r} 11010 \ 01101 \ 1 \ 010 \\ \hline \end{array}$$

11
ashr

$$\begin{array}{r} 11101 \ 00110 \ 1 \ 001 \\ \hline \end{array}$$

01
Add BR

$$\begin{array}{r} 01111 \\ + 01100 \\ \hline 11011 \end{array}$$

ashr

$$\begin{array}{r} 00110 \ 00011 \ 0 \ 000 \\ \hline \end{array}$$

$$= (195)_{10}$$

Solve Using Booth $(+15) \times (-13) = (-195) = (110011101)$ ^{2nd comp of -195}

BR = 01111' $\overline{BR}+1 = 10001$ QR = 10011
